

# It's In Your DNA

By: Greg Peszek

The puzzle is simple on its face: some words are mangled in the sentences and the letter replacement is very straightforward. T<->A, G<->C.

A gambling crisis could be something inside gone coo

coo and could conceivably get resolved by fixing one gene.

The puzzle title should be a small clue and the letters ATGC are used to describe DNA. The using the formatting and by using the transcription (substitution) process gives you AGAGCCTGGC CACCCAGTGG. Unless you know gene sequences by heart a quick lookup will reveal that it is the first 20 bases for **HUMANDOPAMINED2RECEPTOR** the gene that has been linked to gambling disorders.

Other permutations on the gene's name are also acceptable.
